

Your replacement Axe CP-L battery is GPMP0709, BP Series 11.1V 910mAh 15C Lithium Polymer Battery. The improved technology and quality of the 910mAh battery will offer higher performance, longer run time, and cooler operation than the original 950mAh LiPo battery included with your Axe CP-L helicopter.

While the new battery carries a 910mAh rating compared to the 950mAh rating of the original battery, we are very confident that it will actually deliver better performance. Our normal policy is to use the capacity ratings provided by the cell manufacturer. However, cell ratings are often inflated and misleading. The most important consideration is the cell's total performance. This new pack uses higher quality cells, which result in increased longevity and run time in addition to greater safety.

The new, improved LiPo battery also includes a Deans® Ultra™ Connector that has a higher amp rating, providing less power loss with greater ability to conduct under heavier loads.

The graph below shows the replacement BP Series battery in a "Power Comparison" against the original LiPo battery included in the Axe CP-L, while flying at full throttle for an entire flight.
